

Memory Mapped IO used for GPIO

Lecture 2

GPIO for RP2350

- Memory Mapped I/O
 - GPIO Peripheral
- Embedded Rust Stack
- embassy-rs

A few things about Rust

Variables in Rust: const

A few characteristics:

- **Usage:** For values known at compile time that will never change;
- **Immutable:** Constants cannot be changed after they are defined.
- **Compile-Time Known:** The value must be known at compile time.
- **Usual Location in Embedded:** Flash / ROM (with the code) - in other words - it is inlined (so no runtime allocation);
- **Naming Convention:** UPPER_SNAKE_CASE

//EXAMPLES

```
const MAX_UC_SPEED i16: 150;
```

```
const SECONDS_PER_HOUR: u32 = 3600;
```

```
const PI_VAL: f32 = 3.14159;
```

```
const MAGIC_NUMBER i64: 43248578;
```

Variables in Rust: let

A few characteristics:

- **Usage:** For values unknown at compile time that will not change once an initial value is set (for example- values that are read from a config file at boot time);
- **Immutable by Default:** Variables declared with `let` are immutable;
- **Runtime Known:** The value is determined at runtime, usually unknown at compile time;
- **Usual Location in Embedded:** Stored in SRAM (RAM) since it's allocated at runtime.
- **Naming Convention:** `snake_case`

```
1 //EXAMPLES
2
3 let board_id = get_board_id();
4
5 let WiFi_id = read_WiFi_id_from_config();
6
7 let AES_key: [u8; 32] = read_AES_key_from_OTP();
8 // AES-256 key
```

Variables in Rust: let mut

- **Usage:** For variables holding values that might change during program execution.
- **Mutable:** Variables declared with `let mut` are mutable and can be reassigned after initialization.
- **Runtime Known:** The value is determined at runtime, usually unknown at compile time;
- **Usual Location in Embedded:** Stored in SRAM (RAM) because it can change during program execution.
- **Naming Convention:** `snake_case`

```
1  //EXAMPLE
2
3  let mut signal = [0u8, 64];
4
5  loop {
6
7      read_adc_signal(&mut signal);
8      let mut max_fft_value = get_max_fft_value(&signal);
9
10 }
```

Variables: Copy in Rust

A few observations:

- Intuitive and simple for types that implement the

Copy trait:

- primitive types: `i32`, `f64`, `bool`, `char`
 - tuples composed of primitive types
- You need to pay attention for types that do not implement the Copy trait. E.g.:
 - `String`
 - `Vec <_>`

```
//EXAMPLE with int
fn main() {
    let x: i32 = 128; // `x` is an integer (implements `Copy`
    let y: i32 = x; // y copies the value of x
    println!("x = {}, y = {}", x, y);
} // Compiles & prints expected value
```

```
//EXAMPLE with String
fn main() {
    let wifi_name_1 = String::from("RoEduNet");
    // `wifi_name_1` owns the string
    let wifi_name_2 = wifi_name_1;
    // Ownership moves from `wifi_name_1` to `wifi_name_2`
    println!("{}", wifi_name_2);
    // Compiles & prints expected value
    println!("{}", wifi_name_1);
    // compiler ERROR: value borrowed after move
}
```

Variables: Solution for copy for String (example)

A few observations:

- `.clone()` performs a copy of the data
- Unlike a move, both `WiFiName_1` and `WiFiName_2` remain valid and independent of each other (as expected)
- you can do this on data types that support the `clone` method, e.g.:
 - `String`
 - `Vec <_>`

```
1  fn main() {  
2      let wifi_name_1 = String::from("RoEduNet");  
3      let wifi_name_2 = wifi_name_1.clone();  
4      // Creates a copy (clone) of the string  
5  
6      println!("wifi_name_1 = {}", wifi_name_1);  
7      println!("wifi_name_2 = {}", wifi_name_2);  
8  
9      // Both lines compiles & print expected value  
10  
11 }
```

Variables: Simple borrow example

- `&wifi_name_1` creates an immutable reference to `wifi_name_1` without transferring ownership.
- Both `wifi_name_1` and `wifi_name_2` can be used simultaneously.
- Since it's an immutable reference, you cannot modify `wifi_name_1` through `wifi_name_2`.

```
1  fn main() {
2      let wifi_name_1 = String::from("RoEduNet");
3      let wifi_name_2 = &wifi_name_1;
4      // Borrows wifi_name_1 (immutable reference)
5
6      println!("{}", wifi_name_2); //compiler drops the
7      println!("{}", wifi_name_1);
8      // Both lines compile & print expected value
9  }
10
11 fn main() {
12     let wifi_name_1 = String::from("RoEduNet");
13     let wifi_name_2 = &wifi_name_1;
14     // Borrows wifi_name_1 (immutable reference)
15
16     wifi_name_2.push_str("edu_roam");
17     //compiler error: cannot borrow `*wifi_name_2`
18     //as mutable, as it is behind a `&` reference
19
20     println!("{}", wifi_name_2);
21     println!("{}", wifi_name_1);
22     //code does not compile
23 }
```

Variables: How to modify

```
1  fn main() {
2      let mut wifi_name_1 = String::from("RoEduNet");
3      //mutable so it can be modified.
4      let wifi_name_2 = &mut wifi_name_1; // Mut borrow
5
6      wifi_name_2.push_str("_5G");
7
8      println!("{}", wifi_name_2);
9      println!("{}", wifi_name_1);
10     //! NOTE: works with newer compiler versions
11     //(with non-lexical lifetimes (NLL) feature)
12
13 }
14
15 //EX2
16 fn main() {
17     let mut wifi_name_1 = String::from("RoEduNet");
18     let wifi_name_2 = &mut wifi_name_1 ;
19
20     wifi_name_2.push_str("_5G");
21
22     println!("{}", wifi_name_2);
23     println!("{}", wifi_name_1);
24     wifi_name_2.push_str("_high_speed");
25     //compiler error: cannot borrow `wifi_name_1`
26     //as immutable because it is also borrowed as mut
27 }
```

Variables: Functions

```
1  fn change_wifi_name (  
2      wifi_name: &mut String,  
3      string_to_append: &str  
4  ) {  
5      wifi_name.push_str(string_to_append);  
6  }  
7  
8  
9  fn main() {  
10     let mut wifi_name_1 = String::from("RoEduNet");  
11     let extra_name = "Fast_Network";  
12  
13     change_wifi_name(&mut wifi_name_1, extra_name);  
14  
15     println!("{}", wifi_name_1);  
16 }
```

Variables: Functions

```
1  fn change_wifi_name (wifi_name: &str, string_to_append: &str) -> String {
2
3      //let mut new_wifi = String::from(wifi_name);
4      //new_wifi.push_str(string_to_append)
5      //new_wifi
6
7      let new_wifi = format!("{}", wifi_name, string_to_append);
8      new_wifi
9  }
10
11
12 fn main() {
13     let wifi_name_1 = "RoEduNet";
14     let extra_name = "Fast_Network";
15
16     println!("{}", change_wifi_name(wifi_name_1, extra_name));
17
18 }
```

A look at the compiler

```
1  fn integer_division (a:isize, b: isize) -> isize {
2      a / b
3  }
4
5  fn main () {
6      let x = 120;
7      let y = 0;
8
9      println! ("{}:{}_ = {}",
10     x, y, integer_division (x, y));
11
12 }
```

```
1  ...
2  ...
3
4  bb2: {
5      _4 = Eq(copy _2, const 0_isize);
6      assert(!move _4, "attempt to divide `{}`
7  by zero", copy _1) ->
8  [success: bb3, unwind continue];
9      }
10
11     bb3: {
12         _5 = Eq(copy _2, const -1_isize);
13         _6 = Eq(copy _1, const isize::MIN);
14         _7 = BitAnd(move _5, move _6);
15         assert(!move _7, "attempt to compute `{}` / `{}`,
16 which would overflow", copy _1, copy _2) ->
17 [success: bb4, unwind continue];
18     }
19
20     ...
21     ...
```

A better way to do this

```
1  fn integer_division(a: isize, b: isize) -> Option<isize> {
2      if b == 0 {
3          None
4      } else {
5          Some(a / b)
6      }
7  }
8
9  fn main() {
10     let x = 120;
11     let y = 0;
12     match integer_division(x, y) {
13         Some(d) => println!("{}", x, y, d),
14         None => println!("division by 0"),
15     }
16     println!("{}", x, y, integer_division(x, y));
17 }
```

Bitwise Ops

How to set and clear bits

Set bit

set the 1 on position bit of register

```
1 fn set_bit(register: usize, bit: u8) -> usize {
2     // assume register is 0b1000, bit is 2
3     // 1 << 2 is 0b0100
4     // 0b1000 | 0b0100 is 0b1100
5     register | 1 << bit
6 }
```

Set multiple bits

```
1 fn set_bits(register: usize, bits: usize) -> usize {
2     // assume register is 0b1000, bits is 0b0111
3     // 0b1000 | 0b0111 is 0b1111
4     register | bits
5 }
```

Clear bit

Set the 0 on position bit of register

```
1 fn clear_bit(register: usize, bit: u8) -> usize {
2     // assume register is 0b1100, bit is 2
3     // 1 << 2 is 0b0100
4     // !(1 << 3) is 0b1011
5     // 0b1100 & 0b1011 is 0b1000
6     register & !(1 << bit)
7 }
```

Clear multiple bits

```
1 fn clear_bits(register: usize, bits: usize) -> usize {
2     // assume register is 0b1111, bits is 0b0111
3     // !bits = 0b1000
4     // 0b1111 & 0b1000 is 0b1000
5     register & !bits
6 }
```

Flip bit

Flip the bit on position `bit` of `register`

```
1  fn flip_bit(register: usize, bit: u8) -> usize {
2      // assume register is 0b1000, bit is 2
3      // 1 << 2 is 0b0100
4      // 0b1100 ^ 0b0100 is 0b1000
5      register ^ 1 << bit
6  }
```

Flip multiple bits

```
1  fn flip_bits(register: usize, bits: usize) -> usize {
2      // assume register is 0b1000, bits is 0b0111
3      // 0b1000 ^ 0b0111 is 0b1111
4      register ^ bits
5  }
```

Let's see a combined operation for value extraction

- We presume an 32 bits ID = `0b1100_1010_1111_1100_0000_1111_0110_1101`
- And want to extract a portion `0b1100_1010_1111_1100_0000_1111_0110_1101`

```
1  const MASK: u32 = 0b0000_0000_0000_0000_0000_1111_1111_1111;
2
3  fn print_binary(label: &str, num: u32) {
4      println!("{}", num);
5  }
6
7  fn main() {
8      let large_id: u32 = 0b1100_1010_1111_1100_0000_1111_0110_1101;
9      let extracted_bits = (large_id >> 20) & MASK;
10
11     // Print values in binary
12     print_binary("Original_", large_id);
13     print_binary("Mask_____", MASK);
14     print_binary("Extracted", extracted_bits);
15 }
16 /* RESULT
17 Original_: 11001010111111000000111101101101
18 Mask_____: 00000000000000000000111111111111
19 Extracted: 00000000000000000000110010101111 */
```

With nice formatting

```
1  const MASK: u32 = 0b0000_0000_0000_0000_1111_1111_1111;
2  fn format_binary(num: u32) -> String {
3      (0..32).rev()
4          .map(|i| {
5              if i != 0 && i % 4 == 0 {
6                  format!("{}", _, (num >> i) & 1)
7              } else {
8                  format!("{}", (num >> i) & 1)
9              }
10         })
11         .collect::<Vec<_>>()
12         .join("")
13     }
14     fn print_binary(label: &str, num: u32) { println!("{}", label, format_binary(num)); }
15     fn main() {
16         let large_id: u32 = 0b1100_1010_1111_1100_0000_1111_0110_1101;
17         let extracted_bits = (large_id >> 20) & MASK;
18         print_binary("Original_", large_id);
19         print_binary("Extracted", extracted_bits);
20     }
21     /* RESULTS:
22     Original_: 1100_1010_1111_1100_0000_1111_0110_1101
23     Extracted: 0000_0000_0000_0000_0000_1100_1010_1111 */
```

Bitwise Ops - in C

Set the 1 on position bit of register in C

```
1 unsigned int set_bit(unsigned int register_value, unsigned char bit) {
2     // assume register_value is 0b1000, bit is 2
3     // 1 << 2 is 0b0100
4     // 0b1000 | 0b0100 is 0b1100
5     return register_value | (1 << bit);
6 }
```

Set multiple bits

```
1 unsigned int set_bits(unsigned int register_value, unsigned int bits) {
2     // assume register_value is 0b1000, bits is 0b0111
3     // 0b1000 | 0b0111 is 0b1111
4     return register_value | bits;
5 }
```

(test code)

```
1  #include <stdio.h>
2
3  void print_binary(unsigned int num) {
4      for (int i = sizeof(num) * 8 - 1; i >= 0; i--) {
5          printf("%c", (num & (1 << i)) ? '1' : '0');
6      }
7      printf("\n"); //prints "num" number in binary format
8  }
9
10 unsigned int set_bits(unsigned int register_value, unsigned int bits) {
11     return register_value | bits;
12 }
13
14 int main() {
15     unsigned int reg = 0b1000;
16     unsigned int bits_to_set = 0b0011;
17
18     unsigned int result = set_bits(reg, bits_to_set);
19
20     printf("Register before: ");    print_binary(reg);
21     printf("Bits to set: ");       print_binary(bits_to_set);
22     printf("Result after: ");      print_binary(result);
23     return 0;
24 }
```

Combined operation for value extraction in C

```
1  #include <stdio.h>
2  void print_binary(const char *label, unsigned int num) {
3      printf("%s: ", label);
4      for (int i = 31; i >= 0; i--) {
5          printf("%c", (num & (1 << i)) ? '1' : '0');
6      }
7      printf("\n");
8  }
9
10 int main() {
11     unsigned int large_id = 0b11001010111111000000111101101101;
12     unsigned int mask = 0b00000000000000000000111111111111;
13     unsigned int extracted_bits = (large_id >> 20) & mask;
14
15     print_binary("Original_", large_id);
16     print_binary("Mask_____", mask);
17     print_binary("Extracted", extracted_bits);
18
19     return 0;
20 }
21 //RESULT
22 //Original_: 11001010111111000000111101101101
23 //Mask_____: 00000000000000000000111111111111
24 //Extracted: 00000000000000000000110010101111
```

With nice formatting

```
1  #include <stdio.h>
2  void print_binary(const char *label, unsigned int num) {
3      printf("%s: ", label);
4      for (int i = 31; i >= 0; i--) {
5          printf("%c", (num & (1 << i)) ? '1' : '0');
6          if (i % 4 == 0 && i != 0) { printf("_"); }
7      }
8      printf("\n");
9  }
10 int main() {
11     unsigned int large_id = 0b11001010111111000000111101101101;
12     unsigned int mask = 0b00000000000000000000111111111111;
13     unsigned int extracted_bits = (large_id >> 20) & mask;
14
15     print_binary("Original_", large_id);
16     print_binary("Mask_____", mask);
17     print_binary("Extracted", extracted_bits);
18
19     return 0;
20 }
21 //RESULTS
22 //Original_: 1100_1010_1111_1100_0000_1111_0110_1101
23 //Mask_____: 0000_0000_0000_0000_0000_1111_1111_1111
24 //Extracted: 0000_0000_0000_0000_0000_1100_1010_1111
```

MMIO

Memory Mapped Input Output

8 bit processor

a simple 8 bit processor with a text display

The Bus

example for RP2

1. **Memory Controller** asks for data transfer
2. **Internal Bus Routes** the request
 - to the *External Bus* or
 - to the *Internal Peripherals*
3. **External Bus Routes** the request based on the *Address Mapping Table*
 1. to **RAM**
 2. to **Flash**

A real MCU

| | |
|---------------------------|--|
| Cortex-M0+ Peripherals | MCU's <i>settings</i> and internal peripherals, available at the same address on all M0+ |
| Peripherals | GPIO, USART, SPI, I2C, USB, etc |
| Flash | The storage space |
| SRAM | RAM memory |
| @0x0000_0000 | Alias for SRAM or Flash |

System Control Registers

Cortex-M SCR Peripheral @0xe000_0000

Compute the actual address

- $0xe000_0000 + \text{Offset}$

Register Examples:

- **SYST_CSR: 0xe000_e010** ($0xe000_0000 + 0xe010$)
- **CPUID: 0xe000_ed00** ($0xe000_0000 + 0xed00$)

```
1  const SYS_CTRL: usize = 0xe000_0000;
2  const CPUID: usize = 0xed00;
3
4  let cpuid_reg = (SYS_CTRL + CPUID) as *const u32;
5  let cpuid_value = unsafe { *cpuid_reg };
6  // or
7  let cpuid_value = unsafe { cpuid_reg.read() };
```

⚠ Compilers optimize code and processors use cache!

| Offset | Name | Info |
|--------|------------|--|
| 0xe010 | SYST_CSR | SysTick Control and Status Register |
| 0xe014 | SYST_RVR | SysTick Reload Value Register |
| 0xe018 | SYST_CVR | SysTick Current Value Register |
| 0xe01c | SYST_CALIB | SysTick Calibration Value Register |
| 0xe100 | NVIC_ISER | Interrupt Set-Enable Register |
| 0xe180 | NVIC_ICER | Interrupt Clear-Enable Register |
| 0xe200 | NVIC_ISPR | Interrupt Set-Pending Register |
| 0xe280 | NVIC_ICPR | Interrupt Clear-Pending Register |
| 0xe400 | NVIC_IPR0 | Interrupt Priority Register 0 |
| 0xe404 | NVIC_IPR1 | Interrupt Priority Register 1 |
| 0xe408 | NVIC_IPR2 | Interrupt Priority Register 2 |
| 0xe40c | NVIC_IPR3 | Interrupt Priority Register 3 |
| 0xe410 | NVIC_IPR4 | Interrupt Priority Register 4 |
| 0xe414 | NVIC_IPR5 | Interrupt Priority Register 5 |

| 0xe41c | NVIC_IPR7 | Interrupt Priority Register 7 |
| 0xed00 | CPUID | CPUID Base Register |
| 0xed04 | ICSR | Interrupt Control and State Register |
| 0xed08 | VTOR | Vector Table Offset Register |
| 0xed0c | AIRCR | Application Interrupt and Reset Control Register |
| 0xed10 | SCR | System Control Register |
| 0xed14 | CCR | Configuration and Control Register |

Compiler Optimization

compilers optimize code

Write bytes to the `UART` (serial port) data register

```
1  // we use mut as we need to write to it
2  const UART_TX: *mut u8 = 0x4003_4000;
3  // b".." means ASCII string (Rust uses UTF-8 strings by default)
4  for character in b"Hello, World".iter() {
5      // character is &char, so we use *character to get the value
6      unsafe { UART_TX.write(*character); }
7  }
```

1. The compiler does not know that `UART_TX` is a register and uses it as a memory address.
2. Writing several values to the same memory address will result in having the last value stored at that address.
3. The compiler optimizes the code write the value

```
1  const UART_TX: *mut u8 = 0x4003_4000;
2  unsafe { UART_TX.write(b'd'); }
```

No Compiler Optimization

CPUID: `0xe000_ed00` (`0xe000_0000 + 0xed00`)

```
1 use core::ptr::read_volatile;
2
3 const SYS_CTRL: usize = 0xe000_0000;
4 const CPUID: usize = 0xed00;
5
6 let cpuid_reg = (SYS_CTRL + CPUID) as *const u32;
7 unsafe {
8     // avoid compiler optimization
9     read_volatile(cpuid_reg)
10 }
```

`read_volatile`,
`write_volatile`

**no compiler
optimization**

`read`, `write`, `*p`

**use compiler
optimization**

| Offset | Name | Info |

No Compiler Optimization

Write bytes to the `UART` (serial port) data register

```
1  use core::ptr::write_volatile;
2
3  // we use mut as we need to write to it
4  const UART_TX: *mut u8 = 0x4003_4000;
5  // b".." means ASCII string (Rust uses UTF-8 strings by default)
6  for character in b"Hello, World".iter() {
7      // character is &char, so we use *character to get the value
8      unsafe { write_volatile(UART_TX, *character); }
9  }
```

The compiler **knows** that `UART_TX` **must be written** every time.

8 bit processor

with cache

No Cache or Flush Cache

- Cache types:
 - *write-through* - data is written to the cache and to the main memory (bus)
 - *write-back* - data is written to the cache and later to the main memory (bus)
- few Cortex-M MCUs have cache
- the Memory Mapped I/O region is set as *nocache*
- for chips that use cache
 - *nocache* regions have to be set manually (if MCU knows)
 - or, the cache has to be flushed before a `volatile_read` and after a `volatile_write`
 - beware DMA controllers that can't see the cache contents

Read the CPUID

About the MCU

```
1  use core::ptr::read_volatile;
2
3  const SYS_CTRL: usize = 0xe000_0000;
4  const CPUID: usize = 0xed00;
5
6  let cpuid_reg = (SYS_CTRL + CPUID) as *const u32;
7  let cpuid_value = unsafe {
8      read_volatile(cpuid_reg)
9  };
10
11 // shift right 24 bits and keep only the last 8 bits
12 let variant = (cpuid_value >> 24) & 0b1111_1111;
13
14 // shift right 16 bits and keep only the last 4 bits
15 let architecture = (cpuid_value >> 16) & 0b1111;
16
17 // shift right 4 bits and keep only the last 12 bits
18 let part_no = (cpuid_value >> 4) & 0b11_1111_1111;
19
20 // shift right 0 bits and keep only the last 4 bits
21 let revision = (cpuid_value >> 0) & 0b1111;
```

AIRCR

Application Interrupt and Reset Control Register

```
1 use core::ptr::read_volatile;
2 use core::ptr::write_volatile;
3
4 const SYS_CTRL: usize = 0xe000_0000;
5 const AIRCR: usize = 0xed0c;
6
7 const VECTKEY: u32 = 16;
8 const SYSRESETREQ: u32 = 2;
9
10 let aircr_register = (SYS_CTRL + AIRCR) as *mut u32;
11 let mut aircr_value = unsafe {
12     read_volatile(aircr_register)
13 };
14
15 aircr_value = aircr_value & ~(0xffff << VECTKEY);
16 aircr_value = aircr_value | (0x05fa << VECTKEY);
17 aircr_value = aircr_value | (1 << SYSRESETREQ);
18
19 unsafe {
20     write_volatile(aircr_register, aircr_value);
21 }
```

AIRCR Register

Offset: 0xed0c

| Bits | Name | Description | Type | Reset |
|-------|-----------|--|------|--------|
| 31:16 | VECTKEY | Register key: Reads as Unknown On writes, write 0x05FA to VECTKEY, otherwise the write is ignored. | RW | 0x0000 |
| 15 | ENDIANESS | Data endianness implemented: 0 = Little-endian. | RO | 0x0 |
| 14:3 | Reserved. | - | - | - |

| Bits | Name | Description | Type | Reset |
|------|---------------|---|------|-------|
| 2 | SYSRESETREQ | Writing 1 to this bit causes the SYSRESETREQ signal to the outer system to be asserted to request a reset. The intention is to force a large system reset of all major components except for debug. The C_HALT bit in the DHCSR is cleared as a result of the system reset requested. The debugger does not lose contact with the device. | RW | 0x0 |
| 1 | VECTCLRACTIVE | Clears all active state information for fixed and configurable exceptions. This bit: is self-clearing, can only be set by the DAP when the core is halted. When set: clears all active exception status of the processor, forces a return to Thread mode, forces an IPSR of 0. A debugger must re-initialize the stack. | RW | 0x0 |
| 0 | Reserved. | - | - | - |

Read and Write

they do stuff

- Read
 - reads the value of a register
 - might ask the peripheral to do something
- Write
 - writes the value to a register
 - might ask the peripheral to do something
 - SYSRESETREQ

GPIO

General Purpose Input Output - Why

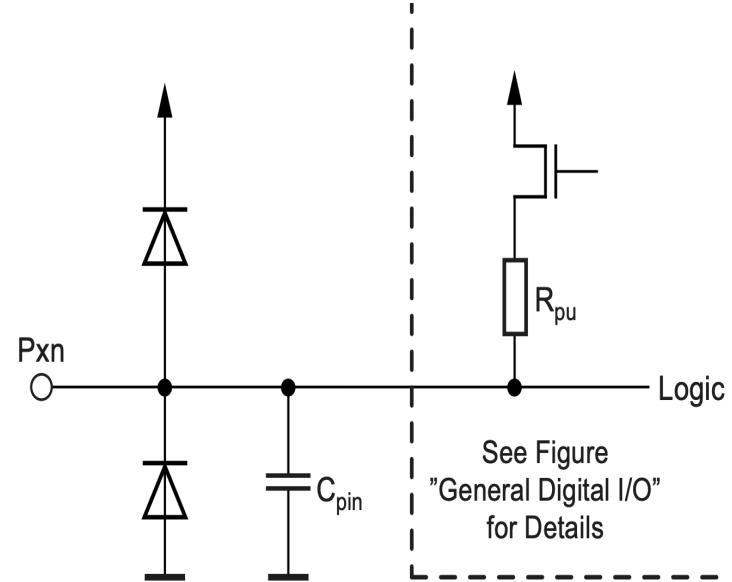

Why GPIO can be complex

This is a minimalistic representation of a typical GPIO pin

the diodes are topical over and under voltage protections

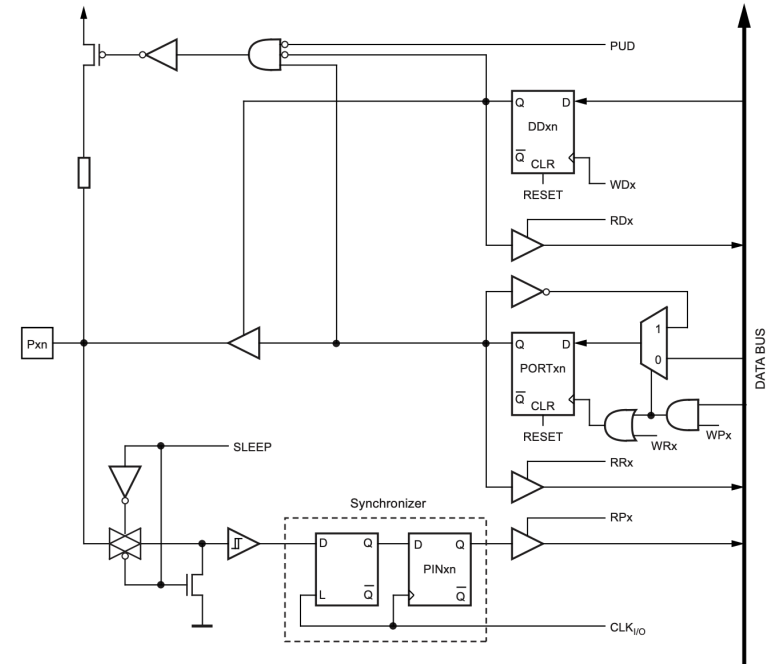

C represents the topical "parasitic" capacity

R_{pu} = Pull-up Resistor with a transistor for on/ off towards the positive supply rail

AVR 328P GPIO

- PUD: PULLUP DISABLE
- SLEEP: SLEEP CONTROL
- CLKI/O: I/O CLOCK
- WD_x: WRITE DDR_x
- RD_x: READ DDR_x
- WR_x: WRITE PORT_x
- RR_x: READ PORT_x REGISTER
- RP_x: READ PORT_x PIN
- WP_x: WRITE PIN_x REGISTER

GPIO on AVR

A simple GPIO

(Note: unlike ARM, AVR is port-mapped)

GPIO on AVR (the simple version)

There are three registers associated with the operation of port pins as digital I/Os:

DDRx - Data Direction Register. If the data direction bit is 1, the pin is an input. 0 is an output.

```
1  DDRB &= ~(1<<DDB7); // Makes pin PB7 an input
2  DDRB |= (1<<DDB5); // Makes pin PB5 an output
```

PORTx - Port Data Register. If a pin is configured as an output, setting the corresponding bit to 1 makes the pin output high. 0 makes the output low.

```
1  PORTB |= (1<<PORTB5); // makes pin B5 high (e.g.: a LED would turn on)
```

PINx - Port Pin Register. Used to read the pin state.

```
1  if (PINB & (1<<PINB7) == 1) { ... } // pin B7 reads a high value
```

Why bare-metal and not just Arduino-style

```
1 void setup() {  
2   pinMode(9, OUTPUT);    //Set D9 as OUTPUT  
3 }  
4  
5 void loop() {  
6   digitalWrite(9, HIGH);  //Set D9 to HIGH  
7   digitalWrite(9, LOW);   //Set D9 to LOW  
8   delay(5);               //To separate the pulses  
9 }
```

with digitalWrite()

```
1 void setup() {  
2   DDRB = B00000010;      //Set D9 as OUTPUT  
3 }  
4  
5 void loop() {  
6   PORTB = B00000010;     //Set D9 to HIGH  
7   PORTB = B00000000;     //Set D9 to LOW  
8   delay(5);              //To separate the pulses  
9 }
```

with register control

 - Section 2.19 - *GPIO* (except Interrupts)

RP2040 GPIO Pins

GPIO pins are connected to the processor pins through three peripherals

GPIO

Peripherals

SIO

Single Cycle Input/Output, is able to control the GPIO pins

GPIO

Multiplexes the functions of the GPIO pins

SIO: Set the pin as Input or Output

IO Bank (GPIO): Use the correct MUX function (F5)

PAD: Set the pin input and output parameters

SIO Registers

The SIO registers start at a base address of `0xd0000000` (defined as `SIO_BASE` in SDK).

| Offset | Name | Info |
|--------|------------------------------|---------------------------|
| 0x000 | CPUID | Processor core identifier |
| 0x004 | GPIO_IN | Input value for GPIO pins |
| 0x008 | GPIO_HI_IN | Input value for QSPI pins |
| 0x010 | GPIO_OUT | GPIO output value |
| 0x014 | GPIO_OUT_SET | GPIO output value set |
| 0x018 | GPIO_OUT_CLR | GPIO output value clear |
| 0x01c | GPIO_OUT_XOR | GPIO output value XOR |
| 0x020 | GPIO_OE | GPIO output enable |
| 0x024 | GPIO_OE_SET | GPIO output enable set |
| 0x028 | GPIO_OE_CLR | GPIO output enable clear |

- Input
 - set `GPIO_OE` bit x to 0
 - read `GPIO_IN` bit x
- Output
 - set `GPIO_OE` bit x to 1
 - write `GPIO_OUT` bit x

GPIO_OE

| Bits | Description | Type | Reset |
|-------|--|------|------------|
| 31:30 | Reserved. | - | - |
| 29:0 | Set output enable (1/0 → output/input) for GPIO0...29. Reading back gives the last value written. If core 0 and core 1 both write to <code>GPIO_OE</code> simultaneously (or to a <code>SET/CLR/XOR</code> alias), the result is as though the write from core 0 took place first, and the write from core 1 was then applied to that intermediate result. | RW | 0x00000000 |

GPIO_IN

| Bits | Description | Type | Reset |
|-------|----------------------------|------|------------|
| 31:30 | Reserved. | - | - |
| 29:0 | Input value for GPIO0...29 | RO | 0x00000000 |

GPIO_OUT

| Bits | Description | Type | Reset |
|-------|---|------|------------|
| 31:30 | Reserved. | - | - |
| 29:0 | Set output level (1/0 → high/low) for GPIO0...29. Reading back gives the last value written, NOT the input value from the pins. If core 0 and core 1 both write to <code>GPIO_OUT</code> simultaneously (or to a <code>SET/CLR/XOR</code> alias), the result is as though the write from core 0 took place first, and the write from core 1 was then applied to that intermediate result. | RW | 0x00000000 |

SIO Input

The SIO registers start at a base address of `0xd0000000` (defined as `SIO_BASE` in SDK).

| 4:0 | FUNCSEL | Function select. 31 == NULL. See GPIO function table for available functions. | RW | 0x1f |

Pad Control

The User Bank Pad Control registers start at a base address of `0x4001c000` (defined as `PADS_BANK0_BASE` in SDK).

| Offset | Name | Info |
|--------|----------------|----------------------------------|
| 0x00 | VOLTAGE_SELECT | Voltage select. Per bank control |
| 0x04 | GPI00 | Pad control register |
| 0x08 | GPI01 | Pad control register |
| 0x0c | GPI02 | Pad control register |
| 0x10 | GPI03 | Pad control register |
| 0x14 | GPI04 | Pad control register |
| 0x18 | GPI05 | Pad control register |

GPIOx Register

Offset: 0x004, 0x008, ... 0x078 ($0x4 + 4 \cdot x$)

| Bits | Name | Description | Type | Reset |
|------|-----------|--|------|-------|
| 31:8 | Reserved. | - | - | - |
| 7 | OD | Output disable. Has priority over output enable from peripherals | RW | 0x0 |
| 6 | IE | Input enable | RW | 0x1 |

| Bits | Name | Description | Type | Reset |
|------|----------|--|------|-------|
| 5:4 | DRIVE | Drive strength. 0x0 → 2mA 0x1 → 4mA 0x2 → 8mA 0x3 → 12mA | RW | 0x1 |
| 3 | PUE | Pull up enable | RW | 0x0 |
| 2 | PDE | Pull down enable | RW | 0x1 |
| 1 | SCHMITT | Enable schmitt trigger | RW | 0x1 |
| 0 | SLEWFAST | Slew rate control. 1 = Fast, 0 = Slow | RW | 0x0 |

Input

read the value from pin x

- set the `FUNCSEL` field of `GPIOx_CTRL` to 5
- set the `GPIO_OE_CLR` bit x to 1
- read the `GPIO_IN` bit x
- *adjust the `GPIOx` fields to set the pull up/down resistor*

Output

write a value to pin x

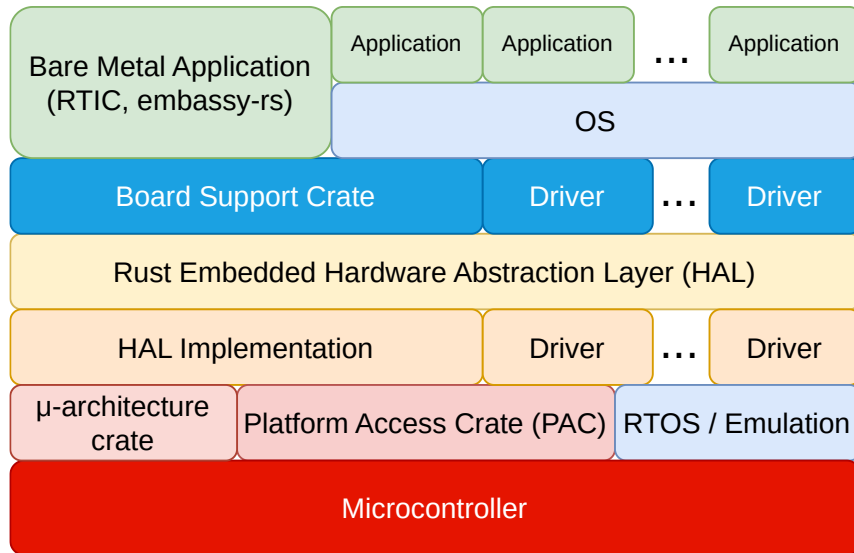

- set the `FUNCSEL` field of `GPIOx_CTRL` to 5
- set the `GPIO_OE_SET` bit x to 1
- if the value
 - is 0, set the `GPIO_OUT_CLR` bit x to 1
 - is 1, set the `GPIO_OUT_SET` bit x to 1
- *adjust the `GPIOx` fields to set the output current*

Rust Embedded HAL

The Rust API for embedded systems

The Rust Embedded Stack

| | |
|---------------------------|--|
| Framework | Tasks, Memory Management, Network etc. <code>embassy-rs</code> , <code>rtic</code> |
| BSC | Board Support Crate <code>embassy-rp</code> , <code>rp-pico</code> |
| <i>HAL Implementation</i> | Uses the PAC and exports a standard HAL towards the upper levels <code>embassy-rp</code> |
| PAC | Accesses registers, usually created automatically from SVD files - <code>rp2040_pac</code> , <code>rp-pac</code> |

GPIO HAL

A set of standard traits

All devices should implement these traits for GPIO.

```
1 pub enum PinState {  
2     Low,  
3     High,  
4 }
```

Input

```
pub trait InputPin: ErrorType {  
    // Required methods  
    fn is_high(&mut self) -> Result<bool, Self::Error>;  
    fn is_low(&mut self) -> Result<bool, Self::Error>;  
}
```

Output

```
pub trait OutputPin: ErrorType {  
    // Required methods  
    fn set_low(&mut self) -> Result<(), Self::Error>;  
    fn set_high(&mut self) -> Result<(), Self::Error>;  
  
    // Provided method  
    fn set_state(&mut self, state: PinState) -> Result<(), Self::Error>;  
}
```

Bare metal

This is how a Rust application would look like

```
1  #![no_std]
2  #![no_main]
3
4  use cortex_m_rt::entry;
5
6  #[entry]
7  fn main() -> ! {
8      // your code goes here
9
10     loop { }
11 }
12
13 #[panic_handler]
14 pub fn panic(_info: &PanicInfo) -> ! {
15     loop { }
16 }
```

Rules

1. never exit the `main` function
2. add a panic handler that does not exit

Bare metal without PAC & HAL

This is how a Rust application would look like

```
1  #![no_std]
2  #![no_main]
3
4  use core::ptr::{read_volatile, write_volatile};
5  use cortex_m_rt::entry;
6
7  const GPIOX_CTRL: u32 = 0x4001_4004;
8  const GPIO_OE_SET: *mut u32 = 0xd000_0024 as *mut u32;
9  const GPIO_OUT_SET: *mut u32 = 0xd000_0014 as *mut u32;
10 const GPIO_OUT_CLR: *mut u32 = 0xd000_0018 as *mut u32;
11
12 #[panic_handler]
13 pub fn panic(_info: &PanicInfo) -> ! {
14     loop { }
15 }
```

```
18  #[entry]
19  fn main() -> ! {
20     let gpio_ctrl = GPIOX_CTRL + 8 * pin as *mut u32;
21     unsafe {
22         write_volatile(gpio_ctrl, 5);
23         write_volatile(GPIO_OE_SET, 1 << pin);
24         let reg = match value {
25             0 => GPIO_OUT_CLR,
26             _ => GPIO_OUT_SET
27         };
28         write_volatile(reg, 1 << pin);
29     };
30
31     loop { }
32 }
```

embassy-rs

Embedded Asynchronous

embassy-rs

- framework
- uses the rust-embedded-hal
- Features
 - Real-time
 - Low power
 - Networking
 - Bluetooth
 - USB
 - Bootloader and DFU

GPIO Input

```
1  #![no_std]
2  #![no_main]
3
4  use embassy_executor::Spawner;
5  use embassy_rp::gpio;
6  use gpio::{Input, Pull};
7
8  #[embassy_executor::main]
9  async fn main(_spawner: Spawner) {
10     let p = embassy_rp::init(Default::default());
11     let pin = Input::new(p.PIN_3, Pull::Up);
12
13     if pin.is_high() {
14
15     } else {
16
17     }
18 }
```

The `main` function is called by the embassy-rs framework, so it can exit.

GPIO Output

```
1  #![no_std]
2  #![no_main]
3
4  use embassy_executor::Spawner;
5  use embassy_rp::gpio;
6  use gpio::{Level, Output};
7
8  #[embassy_executor::main]
9  async fn main(_spawner: Spawner) {
10     let p = embassy_rp::init(Default::default());
11     let mut pin = Output::new(p.PIN_2, Level::Low);
12
13     pin.set_high();
14 }
```

The `main` function is called by the embassy-rs framework, so it can exit.

Signals

Digital Signals - Recap

Signals

Analog vs Digital

- *analog signals* are *real* signals
- *digital signals* are a *numerical representation* of an analog signal (software level)
- hardware usually works with two-level digital signals (hardware level)

Exceptions

- in wireless and in high-speed cable communication things get more complicated

for PCB level / between integrated circuits on the same board / inside the same chip - things are a "a little simpler" - as detailed in the following

Why use digital in computing?

Signal that we *want* to generate with an output pin

Signal that what we actually generate

Why we still use it? Because after passing through an IC or a gate inside an IC - the signal is "rebuilt" and if the "digital discipline" described in the following is respected - we can preserve the information after numerous "passes". Thus, each element can behave with a large margin for error, yet the final result is correct.

Noise Margin

Why is the output not ideal?

The two corresponding voltage output levels are affected by:

- power supply voltage
- output current
- temperature
- variations in the manufacturing process

ICs same voltage

Usually will work as is

- usually, they will be compatible
- conditions:

$$V_{OH_transmitter} > V_{IH_receiver}$$

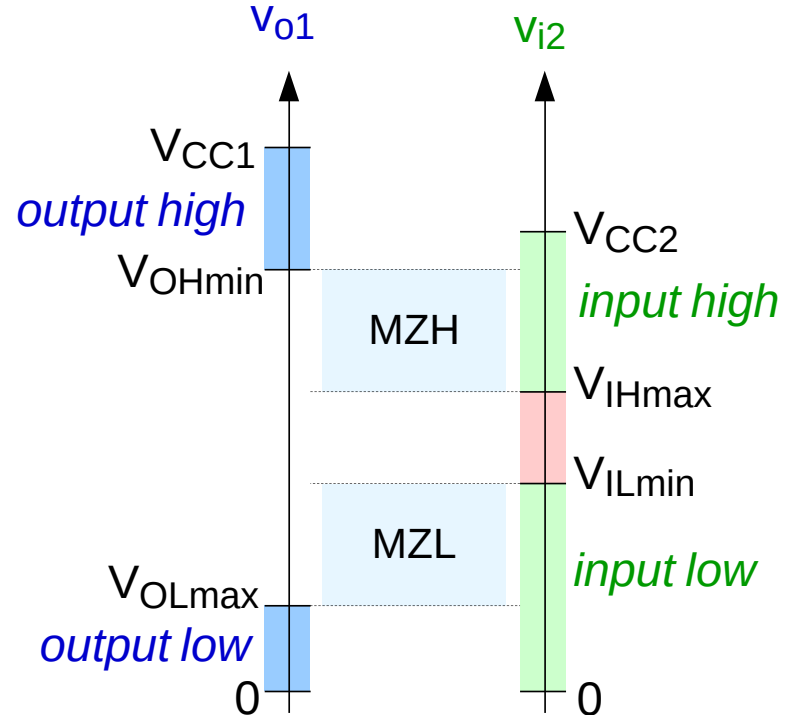

$$V_{OL_transmitter} < V_{IL_receiver}$$

$V_{CC1} > V_{CC2}$

Might work, might produce magic smock

$$V_{OH_transmitter} > V_{CC_receiver}$$

PROBLEM

Solutions:

- level shifter
- resistor divider / voltage limiter

Examples:

- Bi-Directional Level Shifter with 4 Channels
- Level Shifter Multi-Channel
- 8 Channels Level Shifter

$$V_{CC1} < V_{CC2}$$

Might work

$$V_{CC_transmitter} \lesssim V_{IH_receiver}$$

Might work in an intermittent mode - hard to debug!

Solutions:

- level shifter
- resistor divider / voltage limiter

Examples:

- Bi-Directional Level Shifter with 4 Channels
- Level Shifter Multi-Channel
- 8 Channels Level Shifter

Why Pull-Down R

- Without pull-down – when the button is not pressed, it leaves the input pin floating.
- The second design ensures that the voltage level has a well-defined state, regardless of the button's state.
- R1 is called a "pull-down" resistor.

Why Pull-Up R

- Same reasoning
- R1 is called a "pull-up" resistor.

##Obs:

- most microcontrollers have at least a pull-up resistor incorporated on GPIOs - that can be activated in software
- some have both pull-up and pull-down
- typically, these are sized for a 50 - 10 nA current consumption

Notes on output pins

- most microcontrollers have a limit of around 10mA per output PIN
- ! do not connect an LED without a resistor in series (to limit the current)
- ! do not connect a motor / any type of inductive load

Solutions:

- use a transistor
- use an IC with incorporated Darlingtontons (eg: ULN2003)

Conclusion

we talked about

- Memory Mapped IO
- RP2040 GPIO
 - Single Cycle IO
 - IO Bank
 - Pad
- The Rust embedded standard stack
- Bare metal Rust
- The embassy-rs framework
